

What is claimed is:

1. An air fan comprising a frame and a blade portion; said blade
portion including a hub and a plurality of blades spaced around
5 said hub; and said frame including a plurality of locating
members, and a driving section fixedly supported at inner
ends of said locating members to locate at a center of said
frame for said hub of said blade portion to rotatably connect
thereto; said air fan being characterized in that said
10 locating members have inner ends that are upward bent to
axially extend into said frame by a predetermined height,
and that said hub rotatably connected to said driving section
is axially shortened by a length corresponding to said
predetermined height of said bent inner ends of said locating
15 members, enabling airflows produced by said blade portion
rotated by said driving section to move to a space below said
lower surface of said driving section.
2. The air fan as claimed in claim 1, wherein said locating members
20 have inclined outer surfaces to also serve as airflow-guiding
members to guide the airflows produced by said blade portion
rotated by said driving section to more quickly move to the
space below said lower surface of said driving section.
